Manson Creek Commences Work on Virgin Arm Gold Project

Manson Creek Resources Ltd. ('Manson Creek') is pleased to announce the mobilization of field personnel to the Virgin Arm gold project, Newfoundland.

The crew is currently defining prospective areas for the trenching program scheduled for early May. The program will entail up to 1,000 meters of excavated trenches which will be subject to detailed sampling and mapping. The program will also include property wide prospecting, mapping and soil sampling. All of the contractors and logistical requirements are in place for the program.

The current exploration program will focus on expanding known gold occurrences and identifying new areas of gold mineralization within the large claim block. Detailed geological work will be conducted to better understand the controls on gold mineralization, and this knowledge will help to guide follow up work that could culminate in proposed diamond drilling.

The Virgin Arm Property

The road accessible Virgin Arm gold property, covering 1,047 hectares of prospective geology, is located 65 kilometers north of Gander, Newfoundland. The 42 contiguous mineral claims encompass five known gold showings and a regional gold in soil/silt sample anomaly.

Gold mineralization, present in outcrop, has been discovered over a three kilometer long, northeast – southwest trending structural corridor. Visible gold occurs in several localities with reported historical assays as high as 99.7 and 127 grams per tonne. A compilation of known gold occurrences and anomalous gold in soil/silt anomalies shows mineralization is present over five kilometers along this structural trend. The property has seen limited exploration with historical work focused on sampling the known mineralized outcrops.

Corporate

Manson Creek has returned the CR project back to the vendor as the Company continues to focus on gold based assets.
