Manson Creek Resources Ltd. Stakes Additional Uranium Property

Manson Creek Resources Ltd. ("Manson Creek") is pleased to announce the recent staking acquisition of the Stem uranium property, located approximately 30 kilometers from Princeton, British Columbia.

The property was staked due to its geological and structural similarities to the Blizzard uranium deposit, located 90 kilometers to the east. The Blizzard deposit is reported to host a historic, pre 43-101 resource of 2,200,000 tonnes at 0.214% U₃O₈.

The 525 hectare Stem property will be explored for basal type uranium deposits, similar to the aforementioned Blizzard project. These deposits occur in poorly consolidated fluvial or lacustrine sediments. These host rocks are capped by an impermeable horizon, in this case Eocene volcanic flows, and this allows the sediments to maintain a reducing environment favourable to the deposition of secondary uranium minerals in areas of ground water entrapment.

The Stem property possesses numerous favourable parameters for hosting a basal type uranium deposit. These features include: a source of leachable uranium mineralization in the adjacent granitic intrusions, abundant regional faulting which may have provided good ground preparation for groundwater movement and a large zone of permeable sediments that are capped by relatively recent volcanic activity.

The Company is very pleased with the new acquisition which continues the diversification of the Manson Creek western Canadian property portfolio. Manson Creek now has two uranium prospects to complement its base and precious metal prospects, including the CR copper-molybdenum project in northwestern British Columbia and the Meridian and Gillman gold-silver-lead-zinc projects in southeastern British Columbia.
